

Meeting 2

This is the summary of the second meeting held with representatives from Institute A. The table summarizes the purposes, main topics discussed, and outputs of the meeting.

Second meeting	
Stakeholders	Institute A, representative A1, A2, A3, and A4.
Topics of discussion	We discussed the main terminology on plastics, plastic debris, and plastic pollution that will be covered within the ClimOO Ontology. We utilized a list of terms and definitions collected from the literature, the stakeholders' private normative references, and existing ontologies as the starting basis to guide the discussions.
Primary take-home messages regarding plastics, plastic debris, and plastic pollution	• Plastic polymers are distinct from plastic materials and plastic objects. • General synthetic plastics (materials) include additives in addition to polymers; polymers constitute the plastic frame/matrix. • Synthetic plastic: attention to polymeric chains. • Properties such as bio-baseness and biodegradability are primarily properties of the polymers. Consider biodegradable plastics used in agriculture as a matter of example. There is an increased usage of such materials and objects in agriculture. Nevertheless, despite being produced using biodegradable polymers, they are not (at least completely or they are only under certain conditions/in certain contexts) biodegradable, due to their structure or chemical composition, e.g, presence of additives. • Bio-baseness and biodegradability must be distinguished. • The normative standards and laws play a fundamental role in defining such polymers' properties. • The ClimOO Ontology should include a class to refer to monomers. • Stakeholders agree with the classification and the definition of plastic debris proposed by Hartmann et al. (2019). • Inclusion of the proposed terminology concerning analytical measurements of plastic pollution and environmental performance is to be discussed at future stages of the project, if needed.
Framework of reference	Hartmann et al. (2019). Private normative frames regarding environmental performance assessment and plastics analysis.
